

Harnessing the power of the Sun

This is a resource created by the Earthlearningidea Team. It explains how power from the Sun can be used. It includes an activity that gets students to:

- consider if a solar farm could be used in their local area
- work out the advantages and disadvantages of solar farms
- think about the impact a solar farm might have on their local community.

It also includes a list of a series of Earthlearningidea activities that could be used to help to answer the question: 'How will the 'net-zero' target affect your local area?'

Resource available from:
